Helpful Hint

A very helpful product/service we offer at Eagle Pneumatic is the Pressure Test Kit. A pressure test of approximately six (6) P.S.I. shall be held for 4 hours without evidence of leakage before trench is backfilled.

By testing the equipment prior to it being backfilled and/or asphalted over one can avoid possible future costly repair jobs. A fully refundable deposit of 150 dollars has been found to be money well spent by a majority of our dealers. Call Glenn for further information on how you too can make installation one step simpler.

EAGLE SPOTLIGHT

Few systems are installed precisely straight point to point. Occasionally along the way an obstacle occurs. This obstacle may be in the form of a sprinkler, floor joist, overhead beam or a number of other obstructions preventing a straight path between stations. This problem is easily corrected using an Eagle bend. Our quality bends include the popular 90 and 45 degree along with

Bends and more Bends

the 11 and 22 degree bends in 3" and 4" system and a 22-1/2 degree for the 6" system. A particular bend choice is based on how much clearance is needed to overcome the obstruction. Being one of the few "full-service" manufacturers of pneumatic delivery systems we are in the unique position of offering custom bends per design.

All of our bends are made at our manufacturing facility in Lakeland, Florida. Bends are made from PVC and adhere to strict specifications. They undergo rigorous testing before leaving the factory and can be shipped UPS ground unless otherwise specified. Eagle "partial" bends can overcome the toughest installation obstacle.

P.S. Don't forget to order the accessories with your bend part order. They include PVC cement, PVC cleaner, hanging strap, couplings, beam clamps, hangars, and hanging rods.
